Studying the atmospheres of exoplanets

- why and how do we do it?

Alexis Lavail

Launch of the Thunberg Fellowship Programme.
The Swedish Collegium for Advanced Study

Our research goals

1. Detect spectroscopic signatures of exoplanetary atmospheres

Artist impression of the super-Earth exoplanet GJ 1214
Credits: ESO/L. Calçada

Our research goals

1. Detect spectroscopic signatures of exoplanetary atmospheres

- Very large telescope
- High-resolution spectrograph (preferably in the near-infrared)
- Advanced modelling and data analysis

Our research goals

1. Detect spectroscopic signatures of exoplanetary atmospheres

- Very large telescope
- High-resolution spectrograph (preferably in the near-infrared)
- Advanced modelling and data analysis

2. Characterize the atmospheres

- Recover the physical conditions (temperature, pressure etc ...)
- Infer which chemical species are present
- Look for biosignatures, hinting at the presence of life

A Jupiter-mass companion to a solar-type star

Michel Mayor & Didier Queloz

The presence of a Jupiter-mass companion to the star 51 Pegasi is inferred from observations of periodic variations in the star’s radial velocity. The companion lies only about eight million kilometres from the star, which would be well inside the orbit of Mercury in our Solar System. This object might be a gas-giant planet that has migrated to this location through orbital evolution, or from the radiative stripping of a brown dwarf.

The Nobel Prize in Physics 2019 was awarded "for contributions to our understanding of the evolution of the universe and Earth's place in the cosmos"

Detecting an exoplanet.

The radial velocity method.

FINDING PLANETS USING THE RADIAL VELOCITY METHOD

The star moves as it is affected by the gravity of its planet. Seen from the Earth, the star wobbles backwards and forwards in the line of sight. The speed of this movement, its radial velocity, can be determined using the Doppler effect, because the light from a moving object changes colour.

● STAR ● EXOPLANET × CENTRE OF MASS

THE STAR'S VELOCITY TOWARDS THE EARTH (M/S)

This method uses **extremely stable spectrographs** at **ground-based telescopes**.

Detecting an exoplanet.

The **transit photometry** method.

FINDING PLANETS USING TRANSIT PHOTOMETRY

The star's light intensity decreases when the planet passes between the star and our line of sight.

This effect is observed by telescopes on Earth.
